                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Jote-Totoctor: pT7T3D-Pac (Pharmacia) with a modified polylinker; 1st strand cDNA was prepared from 3 pooled polylinker; 1st strand cDNA was prepared from 3 pooled geam cell tumors, and was then primed with a Not I oligo(dT) primer. Double-stranded cDNA was lighted to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. "

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                    of the immunomodulating dimer peptides of the invention. A peptide-type compound or variant is claimed which has immunomodulating dimer peptides of the invention. A peptide-type compound or variant is claimed which has immunomodulating activity.

Including the N-terminal actimed which has immunomodulating activity,

can be comprises the formula; A-B, where A, B = (R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = D, S or N; aa79 = R or G; aa80 = I or N; aa81, aa84= a hydrophobic or small amino acid; aa82 = R or L; aa83 = G or R; and aa represents amino acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to class I HLA-B alphal domain (positions 79-84). They can be used to inhibit cytotoxic T-lymphocytes (CT) from undesirably attacking cells in a host or in vitro. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune considers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mew peptide(s) based on class I HLA antigen domains - used for modulating cytotoxic T-lymphocyte activity towards targets claim 11; Page 54; 61pp; English.

The peptide is used to modulate cytotoxic T-lymphocyte (CTL) activity, either by inhibition or stimulation. It can be used for inhibiting CTL toxicity in transplantations, for inducing CTL activity in parasitic diseases and neoplasha and in studies on viral infection. The peptide can also be used for identifying CTLs which bind to it and removing subsets of CTLs from a T-cell composition. This peptide sequence is more commonly found within larger peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                   treating autoimmune diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of R83061-R83086, R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75-84 of the alpha-1 domain of the class I MHC HLA-B3702. These sequences can be used to extend the period of The Peptides are administered to a patient from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLS)
                                                                                                                                                                                                                                                            16-MAY-1996 (first entry)
HIA-B2702 CTL modulating peptide (B2702.75-84).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HIA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       HIA-B2702 CTL modulating peptide (B2702.75-84(D)). Cytocoxic T lymphocyte; CTL: major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 14; Page 34; 80pp; English.

This sequence represents the alphal-helix of the human sequence, represents the alphal-helix of the human-leucocyte-associated antigen B2702 (HLA-B2702). This sequence, represents the alphal-helix of the human-leucocyte-associated antigen B2702 (HLA-B2702). This sequence, protein protein palantanes of it (such as R95428) can be used to isolate the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane protein p74 from a T-cell lysate. p74 is a T-cells, and is also immunologically cross reactive with the heat shock protein Hsc70. p74 is found in a limited number of cell types, but its particularly expressed on B and T cells. p74 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity expressed on B and T cells. p74 can be isolated by lysis of a suitable coll with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide. Compositions comprising the extracellular fragment of p74 combined with HLA-B2702.60-84 (see R95416), induces calcium influx, and inhibits compositions can be screened for their effect on the cytolysis cardidate compounds can be screened for their effect on the cytolysis activity of T-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate composition containing T-cells and antigen presenting cells (APCS), by adding to the candidate to composition of p74, in an amount sufficient to compete canner.
                                                                                                                             S
class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CILs)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HIA: p74: alphal helix: human-leucocyte-associated antigen; inhibitor; T-cell lysate; membrane protein; mammal; heat shock protein; Hsc70; APC; B cell; calcium influx; cytotoxic I lymphocyte; CTL; differentiation; cytolysis; antigen presenting cell.

Whise strategies are secured membrane proteins - which may half solidate activity and differentiation of CTLS.

Tomposins. comprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLS.

Example: Page 11: 29pp: English.

R95413, and R95415-R95431 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the cumanical properties of the page of a sultable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide.

Compositions comprising the extracellular fragment of p74 combined with the the page of the cytolysis.

Compositions comprising the extracellular fragment of p74 combined with the extracellular portion of p74 and cetermining the amount of binding between the candidate compound and p74.

CT-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate compound and p74.

CM Modifiation of CTL activity can be inhibited in a cellular composition composition of mix the extracellular portion of p74, in an amount sufficient to compete componed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         04-A0G-1997 (first entry)
T-cell modulating peptide #1.

Claim 7: Page 20; 24pp; English.

WOY512-WOY518 represent T-cell modulating peptides that can be used in the method of the invention. These sequences are based on a portion of the major histocompatability complex (MHC) class I antigen (see the major histocompatability complex (MHC) class I antigen (see WOY510). The method is for affecting the course of an autoimmune disease involving T-cell mediated destruction of tissue in mammals. These peptides are used especially to treat insulin-dependent diabetes mellitus, preferably being administered during the pre-clinical stage to delay onset of the disease. Other diseases that can be treated are delay onset of the disease. Other diseases that can be treated are multiple sclerosis, rheumatoid arthritis, psoriasis, pemphigus vulgaris, Sjogren's disease, thyroid disease, Hashinoto's thyroiditis, mysathenia gravis, etc. The peptides modulate T-cell mediated attack on autologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         04-A0G-1997 (first entry)

The present sequence is an immunomodulatory peptide, which comprises a Class I HIA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in the treatment of autoimmune diseases.

We immunomodulating dinmer peptide(s) - based on a class I HiA-B alpha-1 domain, used for preventing rejection of transplants or treating autoimmune diseases.

Frample 1; Page 19; 41pp; English.

Peptides W33784-98 and W33778-9 were assayed for their immunomodulating cartivity. A peptide-type compound or variant is claimed which has a cinmunomodulating activity, including the N-terminal acylated and/or c-terminal amidated or esterified forms of up to 60 anino acids, where the peptide-type compound comprises the formula; A-B, where A, B = C the peptide-type compound comprises the formula; A-B, where A, B = C R and 6-T D, (and 8-79) (land 7-76R); and 7 = D, S or N; and 9-R or G; aa80 = I or N; and 1 and 2 = R or L; and 3 = G or R; and a represents amino acid; and 2 = R or L; and 3 = G or R; and a represents amino acid sequences related to a class I HiA-B alphal domain (positions and 10 acids acids equences related to a class I HiA-B alphal domain (positions of 10 acids acids acids acids and a class I HiA-B alphal domain (positions or undesirably attacking cells in a host or in vitro. They can also be used to inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, response to anti-CD3. The peptide can be used for preventing rejection or remained arthritis and lupus erythematosis. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                             ö

Novel immunomodulatory peptide-type compound - useful for inhibiting
                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                     The present sequence is an immunomodulatory peptide, which comprises a class I HLA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in the treatment of autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               19-JUN-1998 (first entry)

small amino acid; aa82 - R or L; aa83 - G or R; and aa represents amino acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a class I HiA-B alphal domain (positions 79-84). They can be used to inhibit cytotoxic T-lymphocytes (CTL) from undesirably attacking cells in a host or in vitro. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, rheumatoid arthritis and lupus erythematosis. The products can also be
                                                                                                                                                                                                                                                                                                                                                                    used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0 Maximum DB seq length: 1000000

Post-processing: Minimum Match 0% Listing first 45 summaries

pir1:* pir2:* pir3:* pir4:* PIR_62:* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The Ramplification of nucleic acids using buffer soln, and chelating agent - for detecting Hiza class I alleles for determining susceptibility to arthritis etc.

Disclosure; Page 14; 52pp; English.

The sequence is that of a probe which hybridises to one of the bunce of strands) produced during PCR amplification of the Hiza class I alleles. It is specific for a sequence that encodes a Bw4 class I alleles. It is specific for a sequence that encodes a Bw4 class I alleles. It is specific for a sequence that encodes a Bw4 class is alleles. It is specific for a sequence that encodes a Bw4 class is alleles. It is specific for a sequence that encodes a Bw4 class is alleles. It is specific for a sequence that encodes a Bw4 class is alleles. It is specific for a sequence that encodes a Bw4 class is alleles. It is specific for a sequence that encodes a Bw4 class is a sequence that may be indicative of a patients succeptibility to inflammatory arthropathy such as arthritis and arthritis related discenses. Such diseases include reactive arthritis, rheumatoid arthritis, selective arthritis, earthritis, earthrit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      194791.

New DNA for class! I human leucocyte antigens and derived probes and transformed cells, useful for DNA typing, as immunogens etc. Claim 1; Page 11; 23pp; English.
The HLA class I DNA can be used a source of probes for use in DNA typing. Transformed cells, which are useful as immunogens, can be obtained by introducing these DNAs into eucaryotic cells. Sequence 1086 BP; 224 A; 334 C; 356 G; 172 T;
                                                                                                   37
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ratio: 29.00 Length: 6

New DNA for class 1 human leucocyte antigens and derived probes and transformed cells, useful for DNA typing, as immunogens etc.
Claim 2; ppl1-12; 23pp; English.
The HLA class I DNA can be used a source of probes for use in DNA typing. Transformed cells, which are useful as immunogens, can be obtained by introducing these DNAs into eucaryotic cells.

then these introduced into the uterus of a pseudo pregnant mouse. The young were tested to ensure incorporation of the gene into the chromosome, and one of them mated 3 times with a normal male to produce 16 young, seven of which carried the HLA-B51 gene. The transgeneic offspring were immunised with HLA antigen. The spleen lymphocytes were fused with myeloma cells. Hybridomas producing antibodies were selected.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPII; 90:25479/34.

Allotype specific monoclonal anti- HLA antibodies prodn. - using hybridomas derived from transgenic animals carrying HLA gene and immunised with HLA antigen of different allotype Disclosure; Fig 1 A-G; 20pp; English.

The human HLA-Bw52 gene was introduced into mouse L cells and then these cells used to immunise one of the transgenic mice (See Q05693).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               UCJOY, (Mar. 1991) (first entry)

New inositolohosphoryl ceramide synthase genes from fungi - useful for identifying compounds for anti-fungal therapy claim 5; page 49-50; 35pp; English.

The present sequence represents the mRNA of a pure inositolphosphoryl ceramide (IPC) synthase protein from a fungal cell, Candida neoformans. The present invention also describes a method for identifying inhibitory compounds of fungal IPC synthase protein activity. IPC synthase proteins are useful for identifying inhibitors of fungal sphingolipid biosynthesis, as the IPC synthase catalyses a step in the synthesis of biosynthesis of IPC synthase proteins are also useful as probes or primers for identification and isolation of homologous genes or primers sequence 3168 BP; 692 A; 899 C; 812 G; 765 U;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   19-JAW.1999 (first entry)
Candida neoformans IPC synthase encoding cDNA.

The present invention also describes a method for identifying inhibitory compounds of fungal IPC synthase protein activity. IPC synthase proteins are useful for identifying inhibitors of fungal sphingolipid biosynthesis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length: 6

DR Soluble extracellular recombinant mannose receptor protein
Soluble extracellular recombinant mannose receptor protein adjances of infections, cancer, etc.
diagnosis of infections, cancer, etc.
Disclosure; page 21-27: 37pp; English.
The mannose receptor protein (MRP).
Disclosure; page 21-27: 37pp; English.
The mannose receptor protein (MRP) or at least one carbohydrate
Tecognition domain of it derived from an extracellular portion, can
specifically bind pro- or eukaryotic pathogens, eg bacteria, fungi
or viruses, with exposed configurations of mannose,
Or viruses, with exposed configurations on the envelope
glycoprotein. The protein lacks the MRP transmembrane and cytoplasmic
regions and is capable of specifically targeting cells expressing the
specified proteins. The MRPS can also target cancer cells which have
any exposed mannose residues resulting from aberrant glycosylation.
The proteins can be used as probes for such cells, or as fusion
molecules for delivery of specific molecules, eg AZT, ricin, pertussis
or cholera toxins, or CD4 to fix complement, or as an in vivo marker
for immune system cells. The hybrid molecules are esp. capable of
causing an effector molecule to be targeted to a cell, eg a virus.
MRP and antibodies raised to it are also useful as therapeutic or
diagnostic agents, eg for Leishmania proamastigotes, Pneumocystis
carinial, candida albicans, Microbacterium tuberculosis, HV or
influenza virus. The antibodies are also useful to purify the MRP.
The protein may be administered as a coating on a liposome, or as a
powder or lotion.

The protein may be administered as a coating on a liposome, or as a
powder or lotion.
                                                                                                                                                                                    DNA encoding soluble mannose receptor peptide.
